No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A Geneseq 19Jun03:*

                                                                                                                                                                                                                             The present sequence represents a human lectin ss3939 polypeptide. The polynuclectide sequence is a source of probes, which may be used to identify nucleic acids encoding ss3939 proteins, to identify human chromosome number 11, to map genes on human chromosome number 11, to identify diseases associated with chromosome 11, as single-stranded sense or antisense oligonucleotides to inhibit expression of polypeptides encoded by the ss3939 gene, and for gene therapy. The ss33939 polypeptides may be useful for developing treatments for diseases (none specified) associated with defective or insufficient amounts of the polypeptides. The antibodies may be useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22 ATGRLLSGQPVCRGGTQRPCYKVIYFHDTSRRLNFEEAKEACRRDGGQLVSIESEDEGKL

The present sequence is a human extracellular matrix and cell adhesion molecule (XMAD). The XMAD is used for screening a compound for effectiveness as an agonist or antagonist of XMAD. The identified agonist or antagonist are used for treating a disease or condition associated with decreased or increased expression of functional XMAD. The copyrucleotides encoding XMAD are useful in somatic or germline gene therapy to correct a genetic deficiency, to express a conditionally letthar gene product and to express a protein which affords protection therapy to correct a genetic deficiency. They are also used for generating casociated with expression of XMAD. They are also used for generating associated with expression of XMAD. They are also used for generating complexes and to create Knock in humanised animals (pigs) or transgenic animals (mice or rats) to model human diseases oligonuclectide or longer caminals (mice or rats) to model human diseases oligonuclectide or longer fragments on a microarray. Antibodies which specifically bind XMAD may be used for the diagnosis of disorders associated with the expression of XMAD, or in assays to monitor patients being treated with XMAD. ```
regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, tissue repair, healing of burns, incisions, ulcers, treatment of osteoporosis, osteoarthritis, bone degenerative disorders and periodontal disease. The sequences of the invention are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis and myasthenia gravis, allergic conditions such as asthma, thrombolysis or thrombosis and cosquilation disorders. Sequences ABG66666-ABG66758 represent human novel polypeptides of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human novel polymucleotides and associated polypeptides. The polymucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain issue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis. The sequences are involved in chemotactic or chemokinetic activity, regulation of haematopoiesis, treatment of myeloid or lymphoid

The genes are isolated from a range of human tissues disclosed in the specification. CC The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's diaease, allorgies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal or when the man are accounted to the man and anoxia anoxia and anoxia and anoxia and anoxia anox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       141

AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antinifiammatory; antitheumatic; cells they are expressed in, such as: antinifiammatory; antitheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; cardiant; cardiansent; immunosuppressive; antiadgregant; heamostatic; unlinerary; cardiavascular; antianaemic; antiadgregant; heamostatic; unlinerary; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; conding them can be used in gene therapy, antidense therapy and vaccine production, The proteins and polynucleotides are useful for screening for conding them can be used in gene therapy, antidense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, thematoid arthritis, septic shock, pancreatitis, cardiac dysfunction, cheumatoid attritis, septic shock, pancreatitis, cardiac dysfunction, infections, autoimmunity, genetic diseases, haematopoietic disorders, cardenia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, cateoporosis, severe combined immunodeficiency, eczema, allergic rhinitis asthma, diabetes, cancer, multiple sclerosis, depression, chalbeimer's disease, parkinson's disease, neurodegenerative and contrological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 IEKFIENLLPSDGDFWIGLRRREEKQSNSTACQDLYAWTDGSISQFRNWYVDEPSCGSEV 120

The polynucleotide sequences given in AAA26346 to AAA26458 encode the human secreted proteins given in AAY91451 to AAY91691. The human secreted conteins given in AAY91451 to AAY91691. The human secreted proteins given in AAY91451 to AAA91691. The human secreted proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; immunosuppressive; antiHIV; antiHIATMINICATE, inclored; on the corresponding secreted proteins are useful for preventing, treating or antialterpic; osteopathic; antiarthritic; antibacterial; antidabetic; corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the corresponding and proteins are described for each of the amount of the proteins in a sample or by determining the presence of mutations in the polynucleotides. based on which tissues they are most highly expressed on, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foctal deficiencies, blood disorders, discasses of the immune system, altergies, Alzheimer's and behavioural diseases, inflammation, corresponses, arthritis, infections, AIDS, spinal cord injuries, cardiovascular disorders, reproductive disorders, achievascular disorders, reproductive disorders, gastrointestinal disorders, respiratory disorders and metabolic disorders. The proteins or polyvucleotides can also be used as food additives or preservatives. Creansplant rejection of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                          New isolated human genes and the secreted polypeptides they encode, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                           AN13344-403 represent secreted and transmembrane human proteins.

The CDNA sequences are obtained from CDNA libraries, prepared from

CC fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.

CT the encoded polypeptides have specific uses based on their homology to

Known polypeptides, e.g. PRO211 and PRO217 can be used for disorders

CC sasociated with the preservation and maintenance of gastrointestinal

CC uccatated with the preservation and maintenance of gastrointestinal

CC uccatation and congenital maintenance of gastrointestinal

CC uccatation and congenital microvillus arrophy), skin diseases associated

With abnormal keratinocyte differentiation (e.g. psortisms, epithelial

CC cancers such as lung squamous cell carcinoma of the vulva and gliomas),

CC ptent effects on cell growth and development, diseases related to

CC growth or survival of nerve cells including Parkinson's disease,

CC Alzheimer's disease, ALS, neuropathies or cancer. PRO265 can be used as

CC for fibromodulin, e.g. for reducing dermal scarring. PRO264 can be used

CC Usher Syndrome or Atrophia areata; PRO269 can be used as an

CC uttricrombotic agent; PRO287 Polypeptides and portions may have

CC threapeutic applications in wound healing and tissue repair; PRO317 can

CC be used for treating problems of the kidney, uterus, endometrium, blood

CC vessels, or related tissue, e.g. in the heart of genital tract.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      53 ESEDEQKLIEKFIENLLPSDGDFWIGLRRREEKQSNSTACQDLYAWTDGSISQFRNWYVD 112

The present sequence is one of sixty one novel secreted and transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. lung enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, theumatoid arthritis, multiple sclerosis), infertility, AIDS and diabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sixty one nucleic acids encoding PRO polypeptides which are useful in the treatment of skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma) and neurodegenerative diseases (e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                      Sequences AAU29024-AAU29128 represent PRO polypeptides of the invention.
The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of fondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also proteins can be used to determine the presence of tumours and also proteins to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian cubjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ESEDEQKLIEKFIENLLPSDGDFWIGLRRREEKQSNSTACQDLYAWTDGSISQFRNWYVD 112

New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating infilammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's disease.

Claim 12; Fig 50; 473pp; English.

The invention describes sixty one nucleic acids encoding PRO polypeptides (secreted and transmembrane). The PRO polypeptides and nucleic acids are useful in diagnosing or treating enterocolitis, gastrointestinal ulceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriaais or epithelial cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, inflammatory diseases, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapies concerned with re-growth of tissue. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide sequences encoding them. The polynucleotide sequences are useful in molecular biology, as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and their antibodies are useful in preparing medicament for treating a cornening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as cancer, Alzheimer's disease or ischaemia, and in various diagnostic assays.

Alzheimer's disease or ischaemia, and in various diagnostic assays.
                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy

                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of a secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO nucleic acid, a host call comprising the vector, producing a PRO polypeptide (by culturing the host call for the expression of the PRO polypeptide (by culturing the PRO polypeptide from the cell culture), an isolated PRO polypeptide (having at least 80% sequence identity) an isolated PRO polypeptide (having at least 80% sequence identity) an isolated PRO polypeptide (having at least 80% sequence identity) or (c) an isolated signal peptide), a chimaeric molecule comprising a PRO (b) an amino acid sequence encoded by a nucleic acid sequence decoded with an ATCC number (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal peptide), a chimaeric molecule comprising a PRO coplypeptide of fused to a heterologous amino acid sequence, an anti-PRO antibody, detecting a PRO245 or PRO1868 in a sample suspected of containing the polypeptide, linking a bioactive molecule to a cell expressing a PRO245 or PRO1868 and modulating at least one biological activity of a cell expressing a pRO245 or PRO1868. Nucleic acids which encode PRO can be used in the development and screening of therapeutically useful reagents. The nucleic acids may also be used in the activity of a cell expressing those markers. The PRO polypeptide and cuclein electrophoresis, and the isolated nucleic acids may be used for protein electrophoresis, and the sequence acids may be used for protein electrophoresis, and the sequence acids may be used in tissue typing. Anti-PRO acids may be used in tissue typing. Anti-PRO acids may be used in tissue typing and are useful as acids which are useful in diagnostic assays for PRO. PRO and in affinity purification. Cof PRO from recombinant cell cultur
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, in generating probes and in tissue typing -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                        Human; extracellular matrix and cell adhesion molecule; XMAD; gene therapy; genetic disorder; adrenoleukodystrophy; leukaemia; Down's syndrome; cystic fibrosis; Gaucher's disease; myotonic dystrophy; sickle cell anaemia; thalassaemia; autoimmune disorder; adenocarcinoma;
                                                                                                                     The present sequence represents a human lectin ss1939 polypeptide. The polymorlectide sequence is a source of probes, which may be used to identify nucleic acids encoding ss1939 proteins, to identify human chromosome number 11, to map genes on human chromosome number 11, to identify diseases associated with chromosome 11, as single-stranded sense or antisense oligonucleotides to inhibit expression of polypeptides encoded by the ss1939 gene, and for gene therapy. The ss1939 polypeptides may be useful for developing treatments for amounts of the polypeptides. The antibodies may be useful for developing treatments for detecting the presence of ss1939 polypeptides.
                                                                                                                                                                                                                                                                                                                                                      61 EACRRDGGQLVSIESEDEQKLIEKFIENLLPSDGDFWIGLRRREEKQSNSTACODLYAWT

The present sequence is a human extracellular matrix and cell adhesion molecule (XMAD). The XMAD is used for screening a compound for effectiveness as an agonist or antagonist of XMAD. The identified agonist or antagoinst are used for treating a disease or condition associated or antagoinst are used for treating a disease or condition associated with decreased or increased expression of functional XMAD. The polymuclectides encoding XMAD are useful in somatic or germline gene therapy to correct a genetic deficiency, to express a conditionally correct and to express a protein which affords protection associated with expression of XMAD. They are also used for generating chybridisation probes useful in mapping the naturally occurring genomic sequences and to create knock in humanised animals (pigs) or transgenic fragments derived from the polynucleotide sequences may be used as clasments on a microarray. Antibodies which specifically bind XMAD may be create from the polynucleotide sequences may be used as clasmosts of disorders associated with XMAD. Diseases clasments on a microarray. Antibodies which specifically bind XMAD may be used for the diagnosis of disorders associated with XMAD. Diseases consective monitor patients being treated with XMAD. Diseases adrenoleukodystrophy, Down's syndrome, cystic fibrosis, Gaucher's darenoleukodystrophy, Down's syndrome, cystic fibrosis, Gaucher's autenimmune/inflammatory disorders such as acquired immune deficiency syndrome (AIDS), Addison's disease, allergies, anaemia, astomic dermatitis, catherosclerosis, Crohn's disease, allergies, anaemia, astomic dermatitis,
                                 Addison's disease; allergy; anaemia; asthma; atherosclerosis; melanoma; crohn's disease; diabetes mellituus; atopic dermatitis; lymphoma; cancer; glomerulomephritis; multiple sclerosis; Grave's disease; osteoarthritis; osteoporosis; psoriasis; rheumatoid arthritis; ulcerative colitis; infection; cell proliferative disorder; actinic keratosis; myeloma; arteriosclerosis; nootropic; anticonvulsant; antithyroid; nephrotropic; neuroprotective; dermatological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human extracellular matrix and cell adhesion molecules and polynuclectide sequences encoding them, useful for diagnosis, prevention, treatment of genetic, autoimmune and cell proliferative disorders -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     60
                                                                                                                                The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB8040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's
                           Novel 1405 isolated polypeptides, useful for diagnosis, treatment and prevention of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative
                                                                                                                                                                                                                                                                                     disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MRPGTALQAVLLAVLLVGLRAATGRLLSGQPVCRGGTQRPCYKVIYFHDTSRRLNFEEAK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MRPGTALQAVLLAVLLVGLRAATGRLLSGQPVCRGGTQRPCYKVIYFHDTSRRLNFEEAK

The human secreted proteins given in AAY91451 to AAY91691. The human secreted comparing the proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; neuroprotective; antialthergic; osteopathic; antiarthritic; antibacterial; antidabetic; antiasthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or amaliorating medical conditions, e.g. by protein or gene therapy. Also proteins in a sample or by determining the presence of mutations in the polynucleotides. Specific uses are described for each of the amount of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours. neurodegenerative disorders, developmental abnormalities and foctal deficiencies, blood disorders, developmental abnormalities and foctal deficiencies, blood disorders, developmental abnormalities, and behavioural disorders, schizophrenia, catcoimmune diseases, hepatic and renal disease, inflammation, allergies, Alzheimer's and behavioural disorders, schizophrenia, cardiovascular disorders, reproductive disorders, gastrointestinal cor polynucleotides can also be used as food additives or preservatives. The proteins are also useful for identifying their binding partners. Cor polynucleotides can also be used as food additives or preservatives. Cr exemplification, the proteins are sequences used in the pareners.
            antiHiv, antiinflammatory; nootropic; neuroprotective; antiallergic; osteopathic; antiatrhritic; antibacterial; antidibbetic; antiasthma; antipsoriatic; cardiant; gene therapy; cancer; neurological disorder; immune disease; inflammation; blood disorder; tumour.

The cDNA sequences are obtained from cDNA libraries, prepared from

Cf fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.

The encoded polypeptides have specific uses based on their homology to

Known polypeptides, e.g. PRO211 and PRO217 can be used for disorders

CK suscoitated with the preservation and maintenance of gastrointestinal

CK concers and the repair of acute and chronic wucosal lesions

CK concers and congenital microvillus atrophy), skin diseases associated

CK with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CK with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CK with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CK oncers such as lung squamous cell carcinoma of the vulva and gliomas),

CK of promi effects on cell growth and development, diseases related to

CK of promi effects on cell growth and development, diseases related to

CK of fibromodulin, e.g. for reducing dermal scarring. PRO265 can be used

CK of tibromodulin, e.g. for reducing dermal scarring.

CK of Usher Syndrome or Atrophia areata; PRO533 may be used in the treatment

CK of Usher Syndrome or Atrophia areata; PRO569 can be used as an

CK of Usher Syndrome or Atrophia areata; PRO569 can be used as an

CK of therapeutic agent; PRO287 polypeptides and portions may have

CK of therapeutic applications in wound healing and tissue repair; PRO317 can

CK be used for treating problems of the kidney, uterus, endometrium, blood

CK vessels, or related tissue, e.g. in the heart of genital tract.

                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAU29024-AAU29128 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumnour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also proteins can be used to determine the presence of tumours and also breast, prostate, rectal, cervical, or liver tumours, in mammalian choises. The oligonucleotide probes specific for the PRO nucleic acids subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            232
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes sixty one nucleic acids encoding PRO polypeptides (secreted and transmembrane). The PRO polypeptides and nucleic acids are (secreted and transmembrane). The PRO polypeptides and nucleic acids are useful in diagnosing or treating enterocolitis, gastrointestinal culceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriated with abnormal keratinocyte call carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic seril carcinoma, Alzheimer's disease, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, carcaric injury, infertility, birth defects, premature aging, AIDS, cancer, injury, infertility, birth defects, premature aging, AIDS, cancer, also useful for wound repair and associated therapies concerned with re-growth of tissue. The PRO polypeptides and nucleic acid molecules or are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CQDLYAWTDGSISGFRNWYVDEPSCGSEVCVVWYHQPSAPAGIGGPYWFQWNDDRCNMKN 180

The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide sequences encoding them. The polynucleotide sequences are useful in molecular biology, as hybridisation probes, in chromosome and gene mapping, in generating attisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as cancer, Alzheimer's diseasé or ischaemia, and in various diagnostic assays.

ABU71445-ABU71505 represent human PRO polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                           Ä

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, in generating probes and in tissue typing

Claim 12; Fig 50; 484pp; English.

The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nuclectide sequence encoding one of 6 secreted/transmembrane polypeptides, or PRO polypeptides or encoding a CF secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO PRO protein extracellular domain. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, producing a PRO polypeptide was recovering the PRO polypeptide from the cell culture), an isolated PRO polypeptide (having at least 80% sequence identity) or comparable of sequence encoded by a nucleic acid molecule deposited (b) an amino acid sequence encoded by a nucleic acid molecule deposited (b) an amino acid sequence encoded by a nucleic acid molecule deposited (b) an amino acid sequence encoded by a nucleic acid molecule deposited (b) an isolated signal peptide), a chimaeric molecule comprising a PRO cypeptide of tused to a heterologous amino acid sequence, an anti-PRO antibody, detecting a PRO245 or PRO1868 in a sample suspected of containing the polypeptide, linking a bioactive molecule to a cell expressing a PRO245 or PRO1868 and modulating at least one biological activity of a cell expressing a pro245 or PRO1868 and modulating at least one biological activity of a cell expressing a pro245 or PRO1868 and modulating actids which canimals which may be used in the development and screening of tharapeutically useful reagents. The nucleic acids may be used in cypropetide acids may also be used in tissue typing. Anti-PRO antibodies and nucleic acids may also be used in tissue typing. Anti-PRO antibodies
